

Information Coherency with Diverse Data Stores

Cheryl P. Jalbert

JCC Consulting, Inc.

Abstract

A utility company gained major advantages over the years from their Rdb data resource. However, they needed additional applications and were attracted to packages that did not rely on Rdb.

The visual spatialization package (GIS) that was chosen relies on Oracle on Linux for its data store and an intra-net, web-based application using Apache and Java. The web access provided is based on two different prongs. One uses SQL Server running on Windows; the other reads directly from the GIS system. Communication among these is transparent to the users and as close to real time as desired.

The success of the combined architecture has led to improved customer support, greater efficiency, greater safety for the workers, and rave reviews in the press.

This session describes the issues involved in maintaining a coherent approach with different data resources, the use of the JCC LogMiner Loader to replicate the data, as needed, to the Oracle and SQL Server data resources, and the mechanisms developed to provide feedback from those systems to the Rdb database.

CIS (Customer Information System)

- Rdb database designed in 1992.
 - Expanded functionality without need for fundamental change.
 - Rdb V7.2.1.1.1, Open VMS V8.3 with Integrity coming
- Applications
 - DECForms UI replace by Oracle Forms to be replaced by JAVA
 - COBOL, JAVA, BASIC, C, PERL
 - Business logic in stored procedures
- Success level: **HIGH!**

Applications Covered

- CIS (Customer Information Services)
- Billing
- Cash processing
- Credit
- Load management
- New installations
- Outage reporting
- Service assignments
- Trucks and drivers available

“Companions”

- Accounting
- Bill printing
- Automated telephone answering for crisis times
- Service truck location and messaging
- Mapping
- Internet display of data
- Internet bills payments and information updates

Communication with the “Companions”

- The first few “companion” applications have rather simple interfaces with the Rdb database.
- Accounting
 - COBOL creates flat files from the Rdb database and posts them in specific target locations.
 - Accounting software loads the data from the flat file.
- Bill printing:
 - Data provided to the bill printer in a flat file.
 - Printer sets up the layout, prints and also provides PDF bill images.
 - Application (in testing) to find and display the specific PDF file required to review a specific bill so that the bill shows in the standard UI in the exact same format that the customer is viewing.

Communication Gets Somewhat More Interesting

- Telephone answering service
 - Provides support for overflow calls in large outages.
 - Data on the customers needs to be available to the service.
 - Data from the calls must be available promptly to aid outage analysis.
- Current answer
 - Twice a month, flat file is created from the Rdb data and supplied to the service.
 - Flat files come back. (More on this, in a moment.)
- Future
 - A subset of the Rdb database will be directly accessed and updated by the service.
 - The subset to be created with the LogMiner Loader to provide up to the second accuracy.

Writing Data to the DB from a File

- JCC developed a technology for writing data received in flat file or other format into the Rdb database.
 - Asynchronous
 - Custom
 - Takes advantage of specific procedures for specific functions
 - Uses knowledge of specific db design and specific application to maximize results
 - Generic to some extent
- For the purpose of this discussion, we will call the procedures that implement this technology “services.”
 - There is another obvious name, but using it makes this discussion hard to follow.

Outage Reporting Service

- To load the data from the calling service into the database uses an Outage Reporting Service.
- ORS is written in COBOL and JAVA.
- ORS avoids issues of conflicting data updates by utilizing details of the db design.
 - If the outage has not been reported, one is added.
 - If the outage has been reported, columns that are blank can be updated. (The call may provide additional information, such as “There is a tree on the line.”)
 - If the outage has been reported and the relevant columns are not blank, a row is written to a table for additional activity relative to the specific outage.
- ORS is somewhat generic in that it can be used for multiple outage reporting services.
 - Telephone service
 - Internet reports
 - Reports from automatic devices

Trucks in the “Field”

- Service trucks work both routine and emergency issues.
- Tracking service trucks and sending messages between the office and the truck is important.
- Communication with the trucks is via satellite and Qualcomm using HTTPS.
- Messages are in XML.
- Data on location and messages is inserted with a JAVA procedure.
- The procedure has many of the characteristics of other services that write data to the db.
 - Asynchronous
 - Custom
 - Embedded with knowledge of the database design
 - Generic, to some extent

Alternate view provides “drill down” capability. However ...

Mapping Package Example

The screenshot displays the Norton Outage Management System interface. At the top, a status bar indicates "Fraud monitoring is on". The main window is titled "Outage Management System" and features a "Map: Dispatch" dropdown and a "Search: Service Location" input field. The map shows a network of roads and service locations, with several green truck icons and blue star icons. A red outline highlights a specific area on the map.

On the left side, there is a table with the following data:

Truck	Cust/Call	Area	Pre
1/1	Clark Lakes #2		
1/1	Gibsonville #3	Tree	
1/1	Kinderhook #3		
1/1	Stacy #1		
38/2	Kinderhook #3		
1/1	Kinderhook #3		
89	1/1	Duckwall 1 #2	Wire

Below the table, there are sections for "Outage Site" and "Calls", each with a "Pre-Cause" and "Site" column.

Bigger Challenges from “Companion” Applications

- Mapping package
 - Oracle RDMS on Linux
 - Apache and JAVA
 - Intranet presentation
 - Communication of data must be two-way.
- Support for the customers via the internet.
 - Billing and CIS information in SQL Server on Windows
 - Communication of data must be two-way.

Two-Way Data Communication

- Runs the risks of
 - Buried updates
 - Cycles of updates
 - Conflicting information
- Requires
 - Careful definition
 - Careful architecture
 - Leadership
 - Teamwork

Decisions

- Data consistency suggests a “database of record.”
- Definition is required for how the Oracle database gets updates from the Rdb database.
 - Tables of interest.
 - Columns required.
 - Transforms required.
- Definition is required for how the Rdb database gets updates from Oracle.
 - What can be changed via the Oracle interface?
 - What does it map to in the Rdb database?
 - How do we avoid cycles?
- What happens if one of the databases is “down”?

Outages and the Power Grid

- A single outage may be due to something like a tree on a line.
- An ice storm may take out multiple lines, including some trunk lines.
- Difficulty at a substation will affect many residents, but may have a one-stop solution.
- Quick repair benefits from
 - Prompt reporting of information
 - Knowledge of the power grid (substation → circuits → lines → individual sites)
 - Knowing and controlling service truck location

Mapping Package Example

The screenshot shows a web-based interface for an Outage Management System. At the top, the Norton browser window displays the URL "South Central Power Co." and a status bar indicating "Fraud monitoring is on". The interface includes a search bar with "Service Location" and a "Go!" button. A table on the left lists truck assignments, and a map on the right shows a network of service locations with various icons and numbers.

Truck	Cust/Call	Area	Pre
1/1	Clark Lakes #2		
1/1	Gibsonville #3	Tree	
1/1	Kinderhook #3		
1/1	Stacy #1		
38/2	Kinderhook #3		
1/1	Kinderhook #3		
89	1/1	Duckwall 1 #2	Wire

Mapping on Satellite Imagery

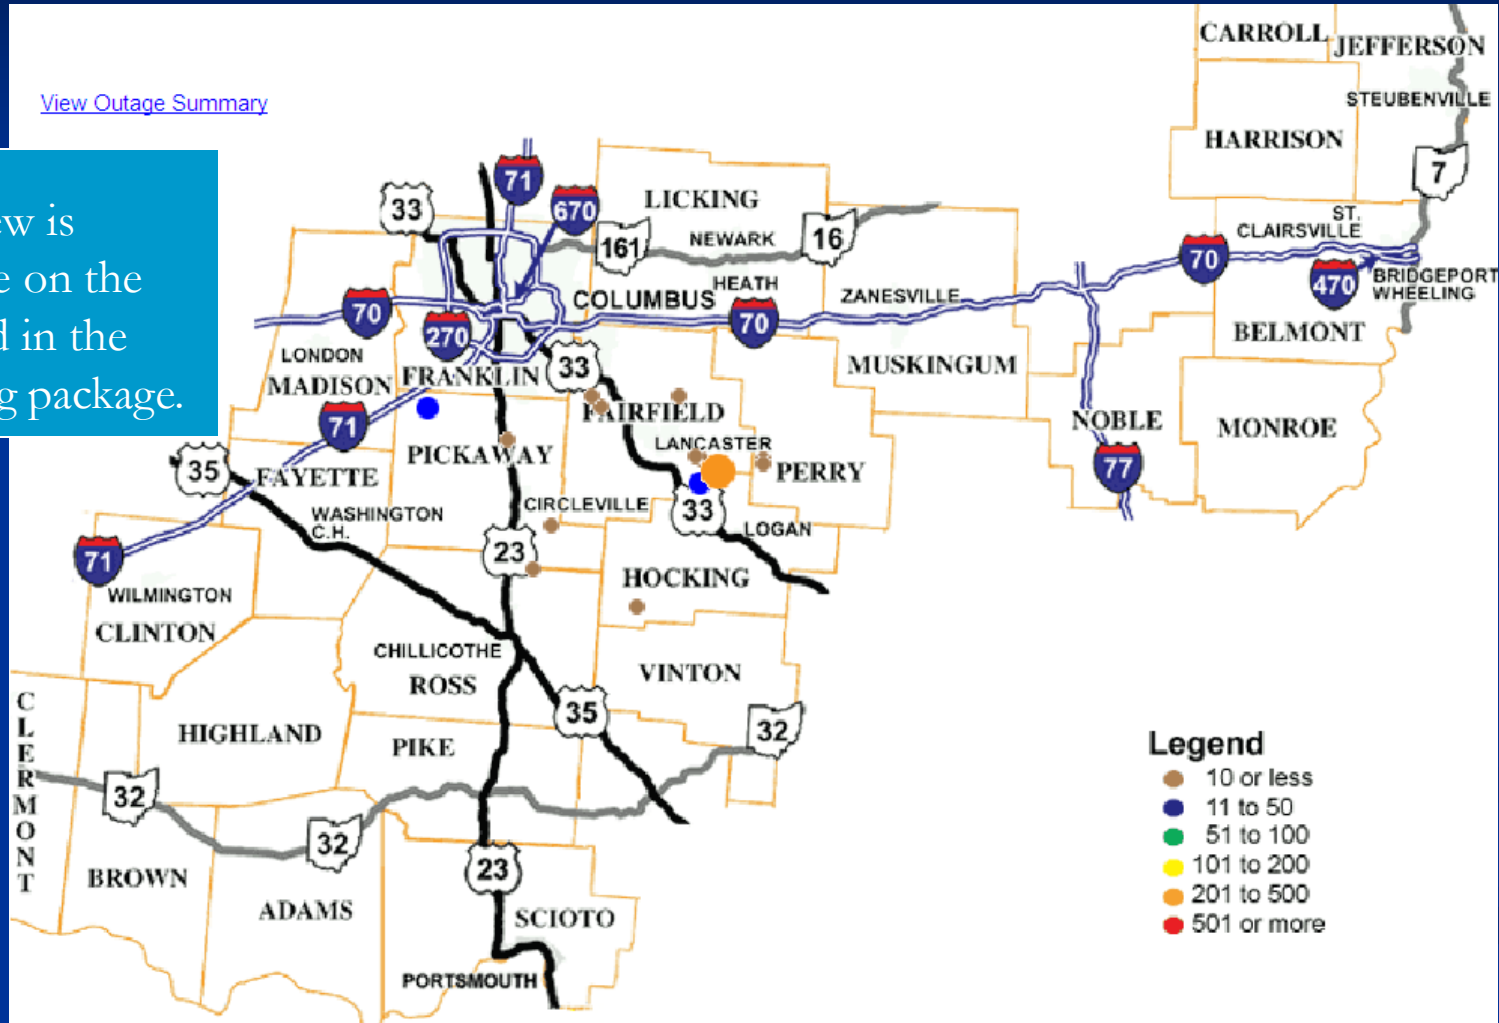

The screenshot displays a software interface for an Outage Management System. The main window shows a satellite map of a rural area with a river and fields. Overlaid on the map are various colored lines representing power lines (red, yellow, green) and several circular markers with icons, some in blue and some in yellow. A central blue star icon is labeled '24'. The interface includes a top navigation bar with 'Norton' and 'Fraud monitoring is on' status. Below the navigation bar is a search area with 'Map: Dispatch' and 'Search: Service Location'. On the left side, there is a table titled 'Outage Management System' with columns for 'Truck', 'Cust/Call', 'Area', and 'Pre'. Below the table is a 'Desktop Messaging' section and an 'Outage Site' section with 'Calls' and 'Pre-Cause' sub-sections. At the bottom of the map, there is a status bar showing coordinates: 'Lat: 39.589591, Lon: -83.125637', a scale of '1 : 15,279', and a distance of '1.98 x 1.46 (mi)'. The system tray at the bottom right shows 'Internet' and '100%' zoom.

Truck	Cust/Call	Area	Pre
1/1	Clark Lakes #2		
1/1	Gibsonville #3	Tree	
1/1	Kinderhook #3		
1/1	Stacy #1		
38/2	Kinderhook #3		
1/1	Kinderhook #3		
89	1/1	Duckwall 1 #2	Wire

Summary View

[View Outage Summary](#)

This view is available on the web and in the mapping package.

Greater Detail

The screenshot shows the South Central Power Company website interface. At the top left is the company logo, a yellow oval with a lightning bolt and the text "South Central Power Co." Below it, it says "A Touchstone Energy Cooperative". To the right of the logo is a navigation menu with links for "Home", "My Account", "Outage Watch", and "Contact Us". Below this is a search bar with a "Search" button. A secondary navigation bar contains links for "Billing", "Electric Service", "Security", "WildBlue", "About Us", and "News". Below this is a breadcrumb trail: "Home : Electric Service : Outage Watch : Outage Map".

The main content area features a map of the Fairfield and Lancaster regions in Ohio. The map is overlaid with colored circles representing the number of customers affected by an outage. A legend on the right side of the map defines the color coding:

- Brown circle: 10 or less
- Blue circle: 11 to 50
- Green circle: 51 to 100
- Yellow circle: 101 to 200
- Orange circle: 201 to 500
- Red circle: 501 or more

On the map, a blue circle is located near Sugar Grove, with a callout box indicating "Number Affected: 372". Other locations shown on the map include Hebron, Kirkersville, Buckeye Lake, Thornville, Pickerington, Canal Winchester, Baltimore, Thurston, Pleasantville, Lithopolis, Carroll, Rushville, Bremen, Stoutsville, and Sugar Grove. Major roads like 204, 37, 158, 188, 674, 22, 159, and 664 are also visible.

On the left side of the map, there are two links: "View Outage Summary" and "Return to Main Map".

At the bottom of the page, there is contact information: "South Central Power Company: 1-800-282-5064" and "OUPS: 1-800-362-2764 | Report Outages: 1-877-688-2437". A "Privacy Policy & Terms of Use" link is also present on the right.

This view is available on the web.

Mapping

- The Mapping package
 - Provides information graphically, providing instant impact.
 - Provides summaries graphically.
 - Includes information on the power hierarchy and connectivity of the grid, not previously available on-line.
- The data synthesis of the map data with the CIS data from the Rdb database and various map sources.
 - Provides the data needed to research a problem and assign a solution → shorter downtime.
 - Avoids duplicate data entry and inconsistent data resources.

Decisions Made

- Rdb is the “database of record”.
- Down time is a risk that is within reason.
 - Rdb has proven reliable enough to trust.
 - Disaster recovery systems are available.
 - LogMiner Loader protects against any downtime on the target side.
 - The only requirement is to save the AIJ backup files until they are processed.
 - The Oracle database can be updated when available again.
 - Outages can be logged without the GIS system.

Oracle to Rdb

- GIS application writes some data directly to the Oracle database.
 - Information related to specifics of the line connectivity.
 - Information not duplicated in CIS (Rdb) db.
- Data of general interest, including outages, is written by the GIS application with a DB-link to a virtual Oracle table that is actually in the Rdb database.
- A write to the table in Rdb triggers an AST doorbell.
- The doorbell triggers another “Service.”

Service Features

- The services that we are discussing
 - Are middleware.
 - Are asynchronous with other work.
 - Handle some updates and pass other updates to task-specific servers.
- The service for writing updates to Rdb from mapping
 - For outages reported for a specific site: writes the outage
 - For outages at the “higher levels” (substation, circuit, group of lines):
 - Writes the information that will show the outage at the highest level
 - Passes the information to an “outage open/close server” to update information for all the sites and intermediate entities within the hierarchy
 - The performance advantage of this two-fold approach will be obvious in a moment.

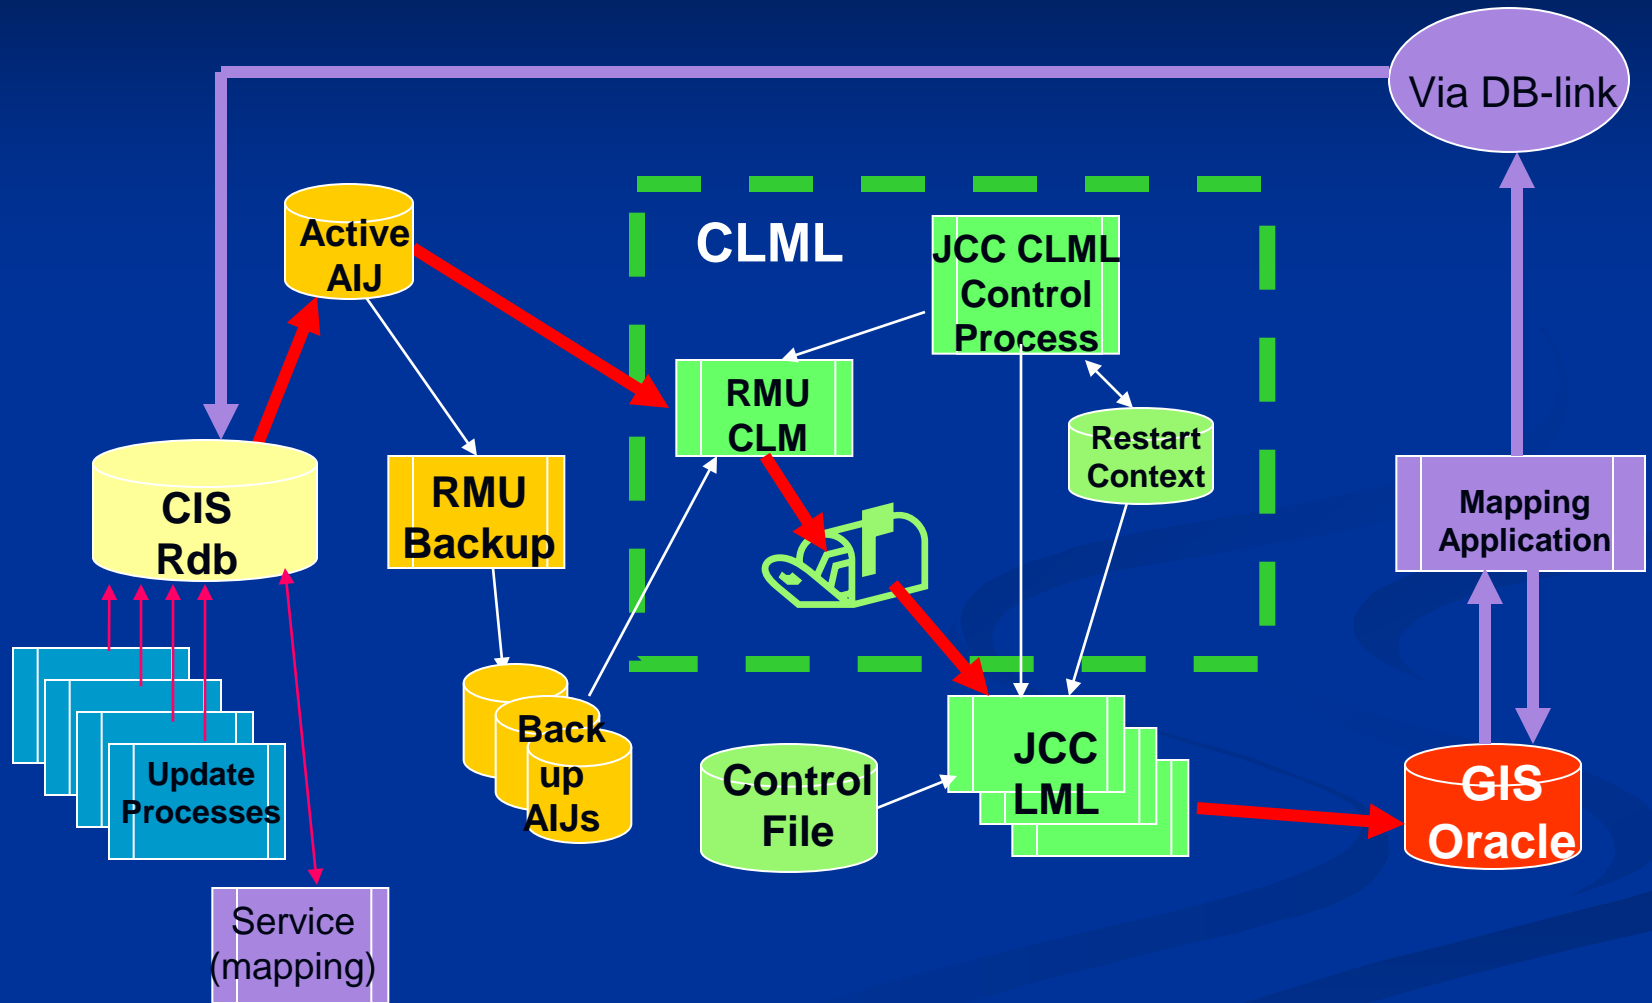

But Wait!

- Remember that the outage data written to the virtual Oracle table is not written directly to the Oracle database.
- As soon as it is written to the Rdb database and committed, it is picked up by LogMiner and the Loader.
- As soon as the Loader writes the data to the Oracle database, the symbol for an outage can be shown on the map.
- This is why it is important to write a substation outage immediately and pass off writing, perhaps, thousands of site outage rows to a server.

The Full Trip

- The full trip sounds lengthy
 - GIS application →
 - DB-link to virtual Oracle table that is in Rdb db →
 - Service →
 - Rdb db outage table →
 - AIJ →
 - LogMiner →
 - LogMiner Loader →
 - Oracle db
- The trip takes on the order of 0.03 seconds.
 - Site outages that are derived (from the site's being connected to the substation that is out) can take somewhat longer without significant impact on planning.

The Full Data Path

Details to Notice

- To the GIS application, the Rdb table accessed via DB-link is just another Oracle table.
- The Service process is just another update process for Rdb.
- The LogMiner Loader Control File is defined to read the data written by the Service process and the servers that it calls, but to exclude the table written via DB-link.
- No cycles of data updates are created.

Time-Out

- JCC's LogMiner Loader works with one source, Rdb, and many targets, including Oracle.
- JCC is often asked if the Loader can add Oracle as a source.
 - JCC has done the preliminary work with excellent support from Oracle Engineering.
 - Completing the work will require development time and funding.
 - There are no immediate plans for completion of this feature.
- However, consider the example.

Oracle to Rdb

- The union of the CIS system and GIS system requires writing data that must appear in both an Oracle db and an Rdb db.
 - The GIS application “knows” only Oracle.
- The solution shown is *application specific*.
- The solution takes advantage of *components already in place*.
- Can the architecture be applied elsewhere?

Management

- Sometimes, the biggest impediment to coherency in data resources is a lack of clear leadership.
 - The issues are technical.
 - The path to updating the Oracle DB is not straightforward to express, but it is successful, robust, and timely.
 - The success requires careful definition of which data requires which treatment.
 - The management decision to avoid duplicating data entry was critical to this architecture.
- Applications that rely on varied data resources and are produced by a variety of teams can work coherently.

Web Access

The screenshot shows a Windows Internet Explorer browser window displaying the South Central Power Company website. The browser's address bar shows the URL <http://www.southcentralpower.com/>. The website features a blue header with the company logo and navigation links: Home, My Account, Outage Watch, and Contact Us. Below the header is a search bar and a navigation menu with links for Billing, Electric Service, Security, WildBlue, About Us, and News. The main content area includes a "News & Info" section with a link to "NRECA/NREA Mini-Grants for Schools". A large banner promotes "Use our secure Online Services to pay your bill or access your account." with a "Sign In" button. To the right is a "Members Sign-In" form with fields for Username and Password, and links for "Forgot password?", "Register", and "Privacy Policy". Below the banner are three columns of links: "Outage Watch" (Check Map for Real-time Outage Information), "How Can We Help You?" (Establish New Service, Report Light Outage, Call Before You Dig, Browse Brochures & Forms), and "Learn More About:" (Understanding Your Bill, Budget Billing, Payment Options, Capital Credits). A "Go Paperless." section shows a hand using a mouse with the text "Receive your bill via email...". The footer contains contact information: South Central Power Company: 1-800-282-5064, OUPS: 1-800-362-2764 | Report Outages: 1-877-688-2437, and a link to "Privacy Policy & Terms of Use".

Web Information

- Two web sites
 - Public
 - Outage data publically available
 - Log-in for
 - Outage reporting
 - Bill viewing
 - Data changes to name, address, etc.
 - Bill payment
 - Contractor specific
 - Log-in for
 - Assignments
 - Report completion

Package with SQL Server

- Data
 - In task-specific SQL Server DBs
 - Each a subset of the Rdb DB data
 - Replicated from the Rdb DB by the LogMiner Loader
- Map views read directly from GIS application
- Updating Rdb
 - JAVA application (another “service”) connects to the SQL Server DB and inserts into the Rdb DB
 - Triggered by a scheduler job

Service for Web Customer Updates

- Service
 - Reads from SQL Server
 - Writes data changes directly, when no transforms are required.
 - Modifies the format of the SQL Server Payment record into data for the Cash Batch Table.
 - Existing components apply cash batches to the payments table and to the Accounting information.
- Note the similarity of approach to the Mapping Service.

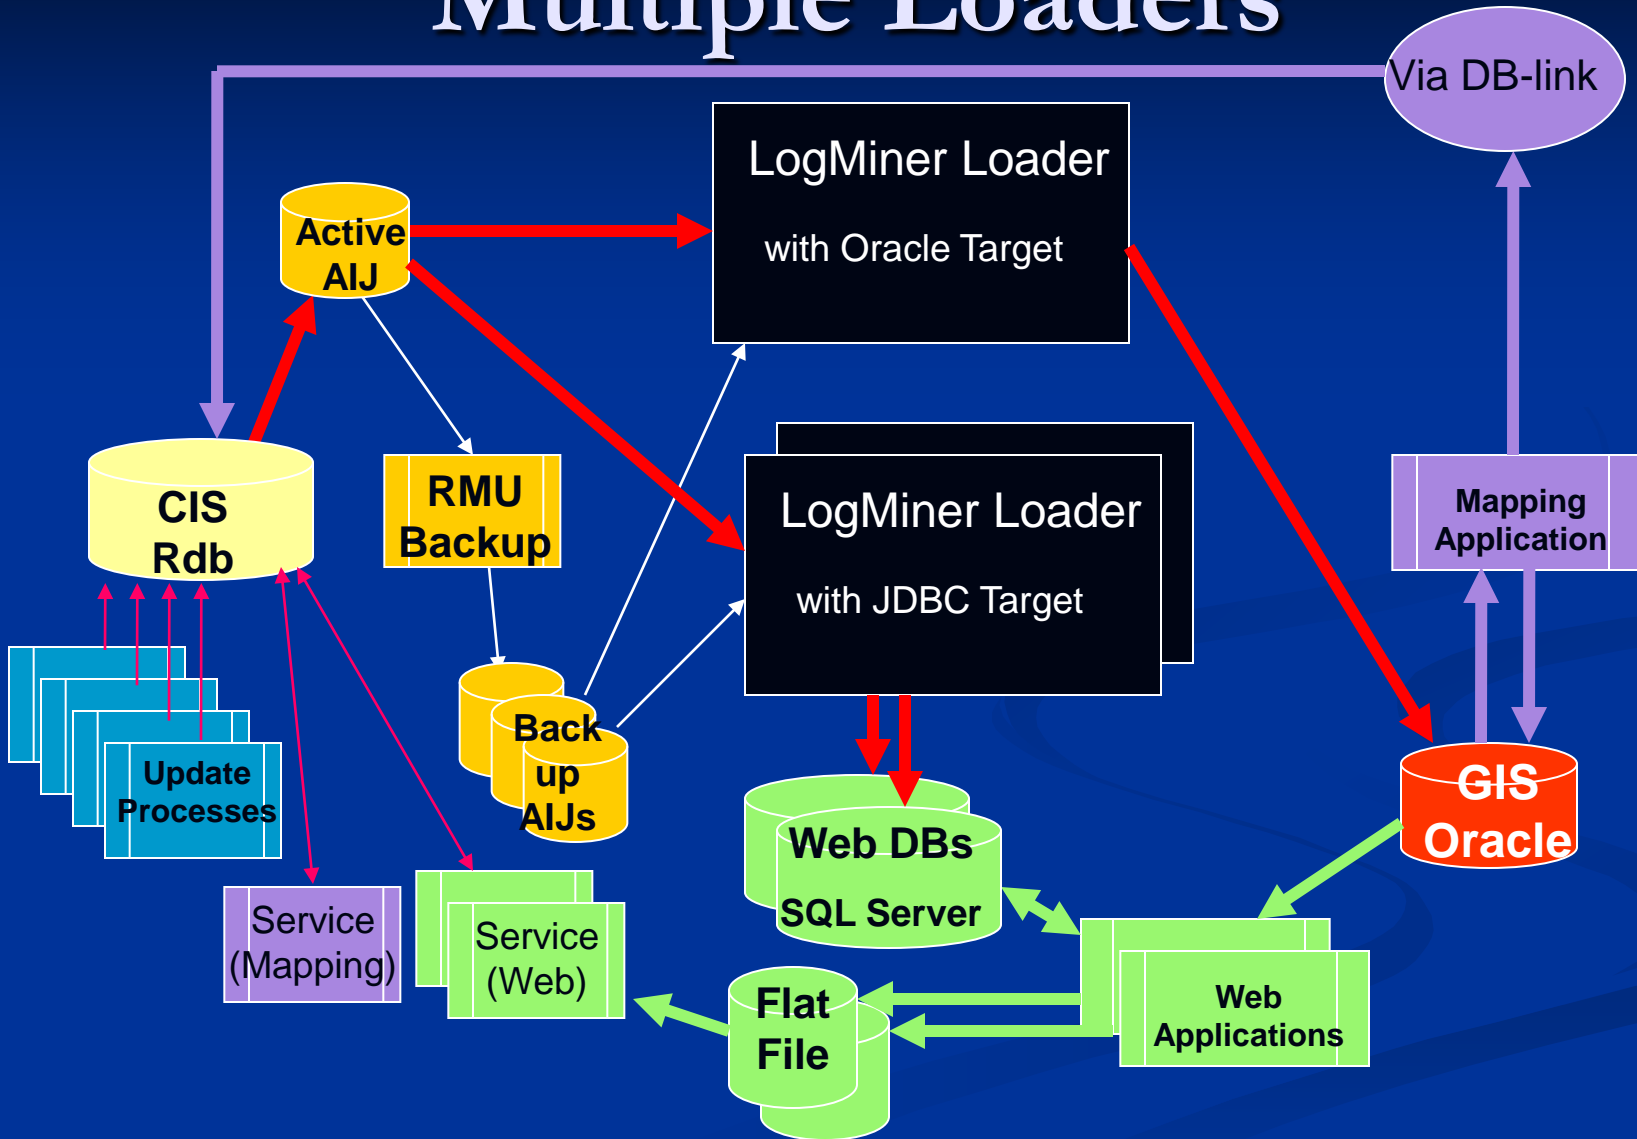

Service for Web Outage Reports

- Web outage reports are fed to the *same* Service that updates the database with reports through the calling service.
 - Custom to the outage reporting activity
 - Generic enough to handle multiple sources

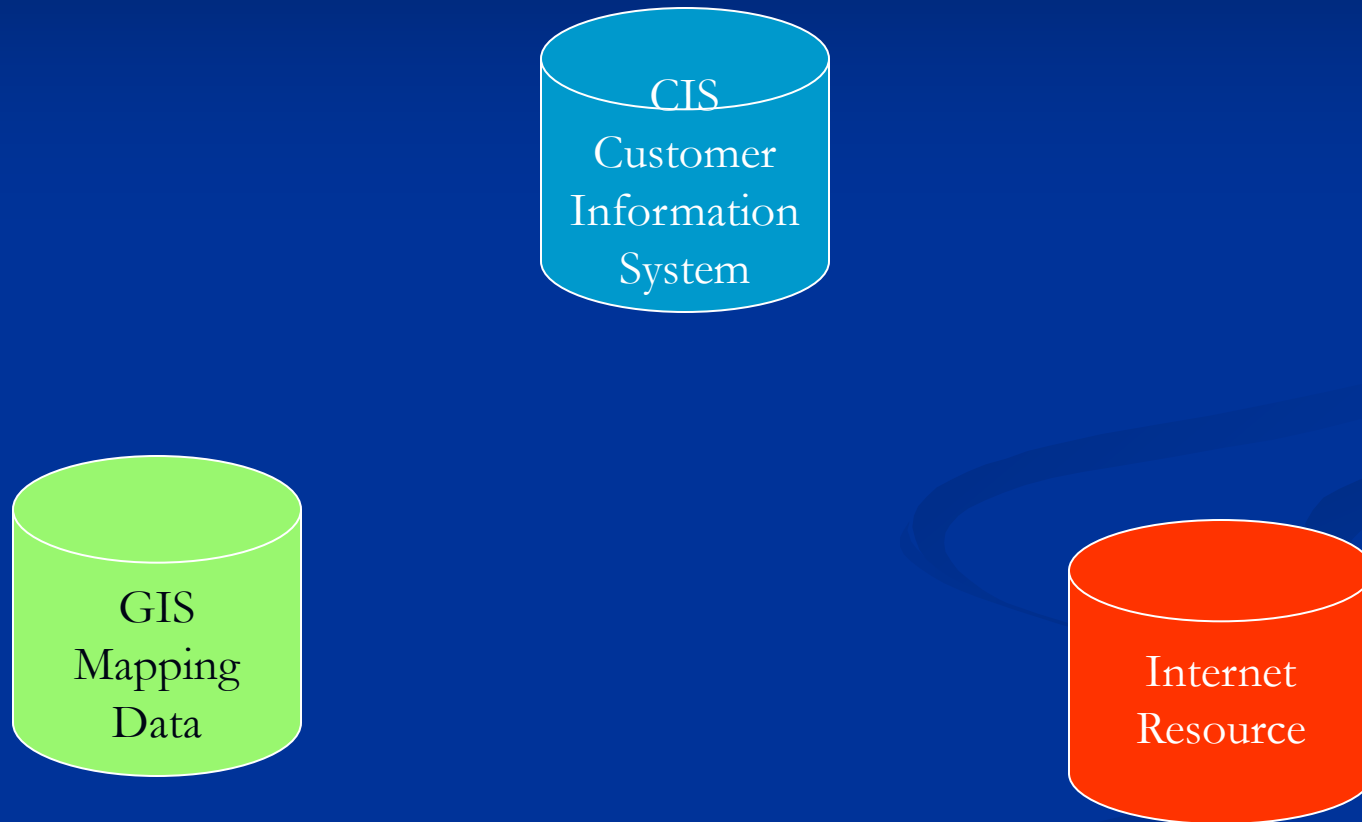

Contractor Web Site

- The web site for contractors supports assignment of work orders.
- Before the web site, orders were generally delayed a day in fulfillment due to inefficient processes.
- Before the Loader the job took seven hours.
- It is now “immediate.”

Multiple Loaders

Coherency

Tools Used

- JCC LogMiner Loader
 - Powerful tool for replication
 - Configurable
 - Supports subsets and some data transforms
 - Provides “near realtime” performance
 - Includes abundant monitoring and testing tools
- Custom “Services” plus existing update servers
 - Custom code
 - Generic concepts

Indications of Success

- Remember the angry press for Duke Power in the December, 2005, ice storm?
- In January, 2007, the Loader user reported here faced a major ice storm.
 - One third of its customers lost power.
 - The company's main office lost power.
 - The company went into its usual crisis mode ...with the additional benefit of
 - Mapping management of resource deployment.
 - Outage information being available to its customers (and the press).
- Customers and the press cheered!

Other Details

- Remember that an Integrity computer is arriving soon?
 - Testing in development will run a workload on the alpha and on the Integrity.
 - The Loader will run on each db to capture the results of the work load.
 - The target for each Loader will be XML.
 - Running differences on the two XML outputs will be straightforward.
 - One limit: We don't expect timestamps to match and so will exclude them.

Availability

- The Loader kit is available at FTP.JCC.COM
 - Documentation
 - Kit
- Evaluation license available on request
 - Send mail to info@jcc.com
- Find descriptions of the LogMiner Loader and other information at <http://www.jcc.com/LML.htm>

Acknowledgements

- Thanks to GateKeeper (Philip A. Naecker [mailto:pan@gatekeeper.com]) for permission to discuss the spatialization (mapping) package.
- Thanks to the “unnamed power company” for permission to share the work and results.
- Thanks to colleagues – Jeff Haidet, Tom Musson, and Jeff Jalbert who developed the server architectures and reviewed my comments.
